

MICHAEL BAKER

Platform Engineering & Developer Experience · AI-Assisted Engineering · CI/CD & Engineering Enablement

Boston, MA | michaelbakerus@gmail.com | linkedin.com/in/-michael-baker | github.com/michael-baker-us | michael-baker-us.github.io/website

Ten years inside a fintech engineering organization, promoted five times across QA, technical product management, and engineering delivery — doing the same job under different titles: finding where software delivery slows down and eliminating the friction. I build the CI/CD platform ~200 repositories run on, drive AI-assisted development adoption across engineering teams, and ship internal tooling myself using Claude Code and GitHub Copilot. I enable engineering organizations rather than owning a single application.

EXPERIENCE

London Stock Exchange Group (LSEG)

Joined Acadia Inc. in 2016; acquired by LSEG in 2022. Promoted five times.

Boston, MA · June 2016 – Present

Engineering Delivery Manager · Platform & Developer Experience

Dec 2024 – Present

- ▶ Built and maintain a GitLab CI component library adopted across ~200 repositories spanning Java/Maven microservices, React applications, .NET services, and Python projects — teams inherit pipeline improvements by bumping a component version instead of hand-editing 200 pipelines.
- ▶ Used that platform to roll out organization-wide capabilities: container and dependency security scanning (Trivy, Semgrep), SonarQube quality gates, AI-assisted merge request reviews, and Artifactory release bundles and promotion workflows.
- ▶ Migrated the organization from on-prem GitLab and Nexus to LSEG's cloud GitLab and JFrog Artifactory with minimal disruption — maintained backwards compatibility for existing configs, workflows, and internal tooling (including Shipit, our internal deployment tool) while security scanning, artifact promotion lifecycles, and corporate requirements were wired in under the covers.
- ▶ Moved our core application stack off OpenJDK/docker.io base images onto Docker Hardened Images (DHI), eliminating the constant remediation churn from vulnerabilities in unused Linux userland packages.
- ▶ Drive AI-assisted development adoption (GitHub Copilot, Claude Code) across engineering through internal documentation, enablement tooling, and hands-on pairing — while using the same tools daily to ship internal tools and automation myself.

Technical Product Manager · TPM, then TPM II

Sep 2021 – Nov 2024

- ▶ Integrated and scaled an offshore development team from external consultants to full-time engineers representing ~30% of total development capacity, building the delivery workflows that made distributed development work.
- ▶ Built proactive production alerting on Prometheus and Elasticsearch/Kibana, with automated email alerts adopted by the support team — issues surfaced internally before users reported them.
- ▶ Built Merlin, a front-end support tool the support organization uses to investigate and resolve customer issues.

QA Manager

Jan 2019 – Sep 2021

- ▶ Led adoption of automated testing tools and practices across the QA organization — an early developer-productivity effort: replacing repeated manual verification with automation in the delivery pipeline.

Senior QA Analyst / QA Analyst / Intern

Jun 2016 – Jan 2019

- ▶ Designed test strategies for critical releases and mentored junior analysts; built the cross-service debugging skills — reproducing failures, isolating root causes — that now anchor my platform work.

TOOLS & TECHNOLOGIES

AI-assisted development	Claude Code, GitHub Copilot, ChatGPT, AI merge request review, prompt engineering
CI/CD & delivery	GitLab CI (reusable components), GitHub Actions, Jenkins, Artifactory, SonarQube, release management
Infra & observability	AWS, Docker, Kubernetes, Terraform, Ansible, Linux, Prometheus, Elasticsearch, Kibana
Security	Trivy, Semgrep, container and dependency scanning
Languages	TypeScript/JavaScript, Python, Bash, SQL

EDUCATION

B.S. Economics, summa cum laude — Bridgewater State University

2016
